Experiment 1.4

Student Name: Sonu kumar

UID:20BCS2157

Branch: CSE

Section/Group:603-B

Semester: 6th

Subject Name: IOT

Subject Code:20CSP358

1. Aim/Overview of the practical:

Program to interface the Arduino/Raspberry Pi with LED and blinking application.

2. Apparatus / Simulator Used:

Components Required:

- You will need the following components –
 - 1 × Breadboard
- 1 × Arduino Uno R3 □ 1 × LED □ 1 × 330Ω Resistor
- 2 × Jumper

3. Objective:

1. Learn about interfacing.
2. Learn about IoT programming.

4. Theory:

LEDs are small, powerful lights that are used in many different applications. To start, we will work on blinking an LED, the Hello World of micro controllers.

It is as simple as turning a light on and off. Establishing this important baseline will give you a solid foundation as we work towards experiments that are more complex.

DEPARTMENT OF

COMPUTER SCIENCE & ENGINEERING

Arduino is a project, open-source hardware, and software platform used to design and build electronic devices. It designs and manufactures microcontroller kits and singleboard interfaces for building electronics projects.

The Arduino boards were initially created to help the students with the non-technical background.

The designs of Arduino boards use a variety of controllers and microprocessors.

The Arduino board consists of sets of analog and digital I/O (Input / Output) pins, which are further interfaced to breadboard, expansion boards, and other circuits.

Such boards feature the model, Universal Serial Bus (USB), and serial communication interfaces, which are used for loading programs from the computers.

Step 1: Start a new sketch in the Arduino IDE. Start a new sketch in the Arduino IDE:

Step 2: Set the pin Mode for Pin 3. ...

Step 3: Set Pin 3 HIGH. ...

Step 4: Compile the code. ...

Step 5: Upload the code to Arduino.

Code

```
int ledPin=8; //definition digital 8 pins as pin to control the LED void
setup()
{
    pinMode(ledPin,OUTPUT); //Set the digital 8 port mode, OUTPUT: Output mode
}
void loop()
{
    digitalWrite(ledPin,HIGH); //HIGH is set to about 5V PIN8
    delay(1000); //Set the delay time, 1000 = 1S
    digitalWrite(ledPin,LOW); //LOW is set to about 5V PIN8    delay(1000);
    //Set the delay time, 1000 = 1S
}
```

Output :
